

### **A reminder of how to use the machine**

- 1. After Reaching Operating Temperature, be sure to purge the hose 2 to 3 times, to eliminate any water in lines.**
- 2. Only turn the steam volume control knob a quarter turn. To do this, turn the knob all the way to the right (clockwise). Next, slowly turn the knob back on, but never more than a quarter of a turn. This makes the cleaning process easier and more effective.**
- 3. If the steam volume control knob is turned too far open, it will put down too much water and not clean as well, it also may shorten the life of the nylon brushes.**
- 4. To properly operate the machine, work slowly across the surface keeping the brush flat against the surface.**
- 5. Move the brush very slowly across the surface allowing the surface to heat. This will break the surface tension of the dirty surface and allow the vapor to work away the soiled area. Let the machine do the work; don't use it as a scrub brush.**

## How to descale your VaporLux

Step 1: Use a commercial descaler. You can purchase this from your local hardware store.

Step 2: Pour the commercial descaler into the empty boiler. Make sure the solution covers the heating element. Follow the manufacturer's instructions on the bottle of descaler for amounts of descaler/water to use.

Step 3: Let the solution soak overnight.

Step 4: The next morning drain the solution by removing drain plug (located on bottom of machine).

Step 5: Flush the boiler with clean water then replace drain plug.

Step 6: You can now use your machine, just fill with water and start cleaning.

\*DO NOT USE VINEGAR TO DESCALE

\*Any commercial descaler is fine to use, just make sure to read the instructions thoroughly.
